

# SIMATS ENGINEERING

## ASSESSMENT TOOL 1

**COURSE NAME:** Cryptography and Network Security

**COURSE CODE:** CSA5113

### COURSE OUTCOME COVERED

**CO1:** Apply classical encryption techniques using symmetric and asymmetric ciphers to encrypt and decrypt data for the ensuring data security. (BL3, BL4)

Assessment Tool Weightage: 40%

**QUESTIONS: 5**

**Total Marks:100**

Annexure A

### APPLICATION- BASED QUESTIONS

#### *Code of Conduct:*

I Siva Kumar M (192521057) (Name / Reg No) certify that this submission is my original work and that I have adhered to the guidelines specified for this assessment.

*I understand that any violation of academic integrity rules will result in disciplinary action.*

*Sivakumar m*

**Signature of the student:**

## APPLICATION- BASED QUESTIONS

### Q1. Scenario: Event Communication Security:

A student organization is preparing to share confidential event details with its core members using a simple classical encryption method. During testing, a message “MEET AT NOON” is transformed into an encoded version using a fixed shift pattern. Reconstruct how the encrypted message might appear if a shift of 4 positions is applied. Explain how an authorized member, aware of the encoding rule, would retrieve the original message.

#### Given

- Plaintext: MEET AT NOON
- Shift value = 4
- Encryption Technique: Caesar Cipher

#### Step 1: Caesar Cipher Formula

Encryption:

$$C = (P + 4) \bmod 26$$

Where:

- P = Plaintext letter
- C = Ciphertext letter

#### Step 2: Encrypt Each Letter

Plaintext   Position   Shift +4   Ciphertext

|   |    |    |   |
|---|----|----|---|
| M | 12 | 16 | Q |
| E | 4  | 8  | I |
| E | 4  | 8  | I |
| T | 19 | 23 | X |
| - | -  | -  | - |
| A | 0  | 4  | E |
| T | 19 | 23 | X |
| - | -  | -  | - |
| N | 13 | 17 | R |
| O | 14 | 18 | S |
| O | 14 | 18 | S |
| N | 13 | 17 | R |

---

Ciphertext  
QIIX EX RSSR

---

### Step 3: Decryption

The receiver already knows the shift is 4.

Decryption formula:

$$P = (C - 4) \bmod 26$$

Example:

Q → M

I → E

I → E

X → T

Repeating for every letter gives

MEET AT NOON

---

### Analysis

- Caesar cipher shifts every letter by a fixed amount.
  - It is easy to implement.
  - Only 26 possible keys exist.
  - Therefore, it can be broken easily using brute-force attacks.
- 

### Result

Original Message

MEET AT NOON

↓

Encrypted

QIIX EX RSSR

↓

Decrypted

MEET AT NOON

**Q2. Scenario: Intercepted Suspicious Message :**

A cybersecurity intern intercepts the coded message: “GSRH RH Z HVXIVG” during network monitoring. The structure of the text suggests a simple substitution mechanism rather than complex encryption.

Deduce the most likely original message. Justify your answer by analyzing repeating patterns, letter structures, or known cipher characteristics.

### Given Ciphertext

GSRH RH Z HVXIVG

---

### Observation

The ciphertext contains repeated words.

- RH appears twice.
- One-letter word = Z

This matches the characteristics of the **Atbash Cipher**.

In Atbash,

### Plain Cipher

|   |   |
|---|---|
| A | Z |
| B | Y |
| C | X |
| D | W |
| E | V |
| F | U |
| G | T |
| H | S |
| I | R |
| J | Q |
| K | P |
| L | O |
| M | N |
| N | M |
| O | L |
| P | K |
| Q | J |
| R | I |
| S | H |
| T | G |
| U | F |
| V | E |

### Plain Cipher

|   |   |
|---|---|
| W | D |
| X | C |
| Y | B |
| Z | A |

---

### Decrypt Letter-by-Letter

#### Cipher Plain

|   |   |
|---|---|
| G | T |
| S | H |
| R | I |
| H | S |

---

### Original Message

**THIS IS A SECRET**

---

### Justification

1. Repeated word RH becomes IS.
2. Single-letter word Z becomes A.
3. Letter frequency perfectly matches English.
4. Atbash is a substitution cipher with reversed alphabets.

---

### Result

Ciphertext

**GSRH RH Z HVXIVG**

↓

Plaintext

**THIS IS A SECRET**

### Q3. Scenario: Secure Messaging System:

A company deploys a keyword-based encryption technique for internal communication. An employee sends the word “HELLO” using the keyword “KEY” to ensure confidentiality. Demonstrate how the encryption process transforms the message step-by-step. Explain how the repeating keyword influences each character of the ciphertext.

**Plaintext**

HELLO

Keyword

KEY

---

**Step 1: Repeat Keyword**

Plain text : H E L L O

Keyword : K E Y K E

---

**Step 2: Alphabet Positions****Letter Number**

|   |    |
|---|----|
| H | 7  |
| E | 4  |
| L | 11 |
| L | 11 |
| O | 14 |

Keyword

**Letter Number**

|   |    |
|---|----|
| K | 10 |
| E | 4  |
| Y | 24 |
| K | 10 |
| E | 4  |

---

**Step 3: Encryption**

Formula

$$C = (P + K) \bmod 26$$

---

| Plain P | Key K   | Sum  | Cipher |
|---------|---------|------|--------|
| H       | 7 K 10  | 17   | R      |
| E       | 4 E 4   | 8    | I      |
| L       | 11 Y 24 | 35→9 | J      |
| L       | 11 K 10 | 21   | V      |
| O       | 14 E 4  | 18   | S      |

---

## **Ciphertext**

### **RIJVS**

---

#### **Effect of Repeating Keyword**

The keyword repeats continuously.

KEYKEYKEY...

Each plaintext letter is shifted by a different amount.

Example

H shifted by K

E shifted by E

L shifted by Y

Therefore,

Same letters may encrypt differently depending on keyword position.

This makes Vigenère much stronger than Caesar Cipher.

---

#### **Result**

Plaintext

HELLO

↓

Keyword

KEY

↓

Ciphertext

**RIJVS**

## **Q4 Scenario: Suspicious Digital Asset Investigation**

During a digital forensic audit, investigators suspect that a company logo file may contain hidden confidential information embedded within it. The file appears normal upon casual inspection. Analyze how investigators could detect the presence of hidden data within the image. Recommend two techniques that could strengthen the security of such hidden communications against detection or extraction.

### **Problem**

Investigators suspect that confidential information is hidden inside a company logo image.

---

## **Detecting Hidden Data**

### **Method 1: LSB (Least Significant Bit) Analysis**

Many steganography techniques modify only the least significant bits of pixels. Investigators can compare pixel values. If unusual LSB patterns exist, hidden data may be present.

---

### **Method 2: Statistical Analysis**

Investigators examine

- Histogram
- Pixel distribution
- Entropy
- Noise patterns

Abnormal statistical properties indicate embedded data.

---

### **Method 3: File Size Comparison**

If

- Original logo = 300 KB
- Suspicious logo = 450 KB

then additional hidden information may exist.

---

### **Method 4: Steganalysis Tools**

Common tools include

- StegExpose
- Stegdetect
- OpenStego
- zsteg
- Binwalk

These tools inspect images for hidden payloads.

---

## **Two Methods to Improve Security**

## 1. Encrypt Before Hiding

Plaintext

↓

AES Encryption

↓

Ciphertext

↓

Hide inside image

Even if extracted, attackers cannot understand the content without the encryption key.

---

## 2. Random Pixel Embedding

Instead of storing data sequentially,  
hide it in randomly selected pixels using a secret key.

Advantages

- Harder to detect.
  - Resistant to statistical attacks.
- 

## Result Analysis

Combining encryption with steganography provides two levels of security:

1. Hidden communication.
2. Protected content even if detected.

## Q5. Scenario: Legacy Encryption in Corporate Communication

A legacy system in a company still uses a transposition-based encryption method with three levels of arrangement. A received message appears as:  
“WECRLTEERDSOEFEAOCAIVDEN”.

- a. Determine the most probable original message by reversing the encryption process.
- b. Critically evaluate why such a method is vulnerable in modern communication systems.
- c. Propose one practical enhancement to improve the confidentiality of messages in this scenario.

## Given Ciphertext

WECRLTEERDSOEFEAOCAVDEN

This is encrypted using a **Rail Fence Cipher** with **3 rails**.

---

### **(a) Decryption**

#### **Step 1: Rail Pattern**

Rail 1 : W . . . E . . . C . . . R . . . L . . . T . . . E

Rail 2 : . E . R . D . S . O . E . E . F . E . A . O . C .

Rail 3 : . . C . . R . . I . . V . . D . . N

**Reading in zigzag order reconstructs the message:**

WE ARE DISCOVERED FLEE AT ONCE

**Without spaces:**

WEAREDISCOVEREDFLEEATONCE

---

#### **Original Message**

**WE ARE DISCOVERED FLEE AT ONCE**

---

### **(b) Why Rail Fence Cipher is Vulnerable**

#### **1. No Key Complexity**

Only the number of rails acts as the key.

Usually only 2–10 possibilities exist.

---

#### **2. Easily Broken**

Attackers try different rail values.

The correct English sentence quickly appears.

---

#### **3. Letter Frequency Preserved**

The letters themselves are unchanged.

Frequency analysis is still possible.

---

#### **4. Weak Against Modern Computing**

Modern computers test every possible rail arrangement within milliseconds.

---

### **(b) Practical Enhancement**

## Recommendation

Encrypt the message using **AES (Advanced Encryption Standard)** before transmission.

Advantages:

- Uses a strong secret key (128, 192, or 256 bits).
- Resistant to brute-force attacks.
- Widely used in banking, military, and secure communication.
- Provides strong confidentiality.

Alternatively, if a classical enhancement is required, combine **Rail Fence + Vigenère Cipher** to increase security.

---

## Final Result

- **Original Ciphertext:** WECRLTEERDSOEFEAOCAVDEN
- **Recovered Plaintext:** **WE ARE DISCOVERED FLEE AT ONCE**
- **Weakness:** Easy to break because only letter positions change.
- **Improvement:** Use AES (or combine transposition with a substitution cipher such as Vigenère)
